

Aortachirurgie

U.Sonker

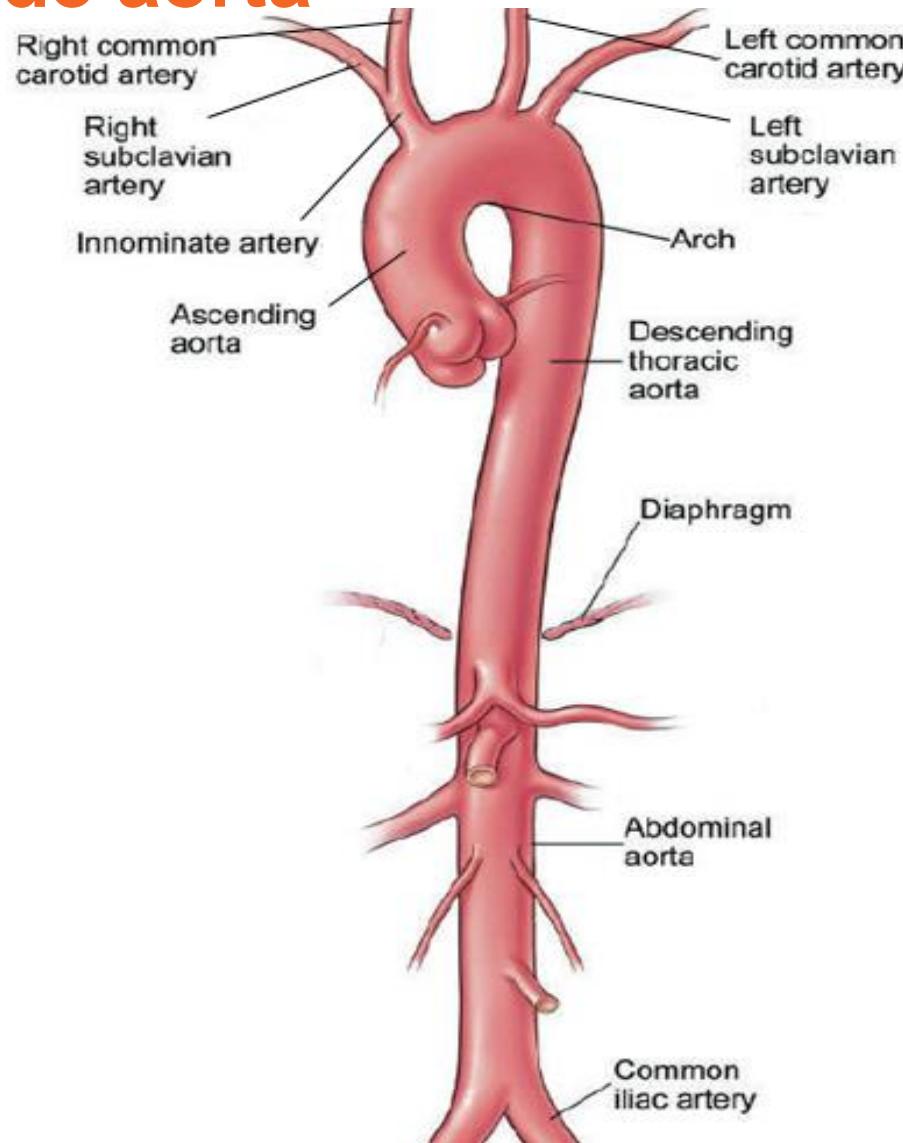

Uitgangspunten voor de behandeling van de aorta zijn:

- Aanpassing van de levensstijl
- Medicamenteuze behandeling
- Operatieve behandeling

Thoracale aorta pathologie

- Aorta dissectie
 - Type A dissectie
 - Type B dissectie
- Aorta aneurysma
 - Wortel
 - Ascendens
 - Arcus
 - Thoracaal aneurysma (TAA)
 - Abdominaal aneurysma
 - Thoraco-abdominaal aneurysma (TAAA)

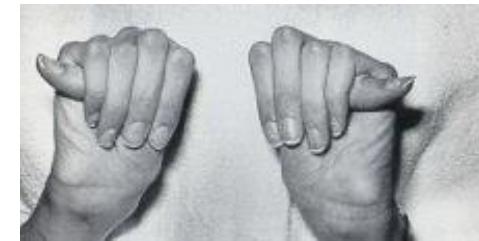

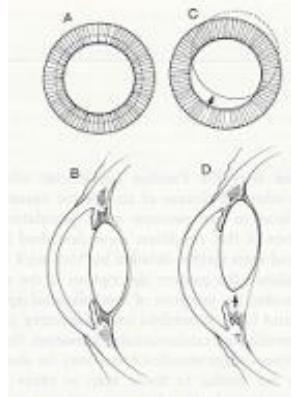

Anatomie van de aorta

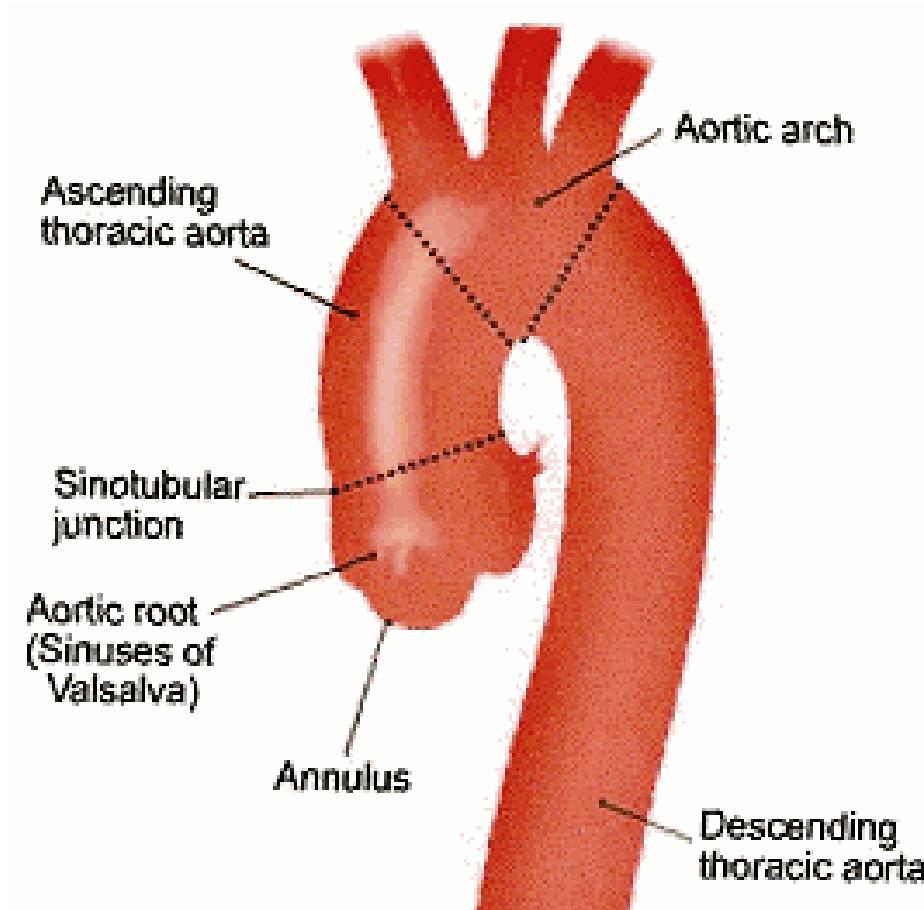

Thoracale aorta aneurysmata

- Aneurysma: verwijding van een bloedvat >50% van de verwachte diameter
- Etiologie:
 - Degeneratief
 - Post-dissectie
 - Vasculitis of aortitis (mycotisch aneurysma)
 - Genetische bindweefselziekte
 - M. Marfan
 - Loeys-Dietz syndroom
 - Ehlers-Danlos syndroom
 - Bicuspid aortaklep (primaire wandzwakte vs. post-stenotisch?)

Bindweefselziekten- MARFAN SYNDROME

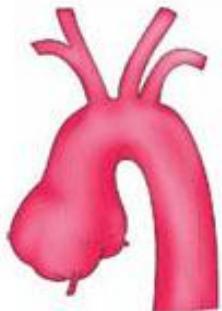

Anatomie

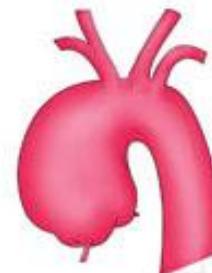

Thoracale aneurysmata

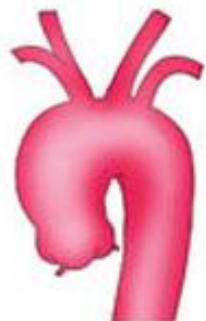

Aortic Root Aneurysm

Ascending Aortic Aneurysm

Aortic Arch Aneurysm

Descending Aortic Aneurysm

Thoracale aorta aneurysmata- indicatie tot chirurgie

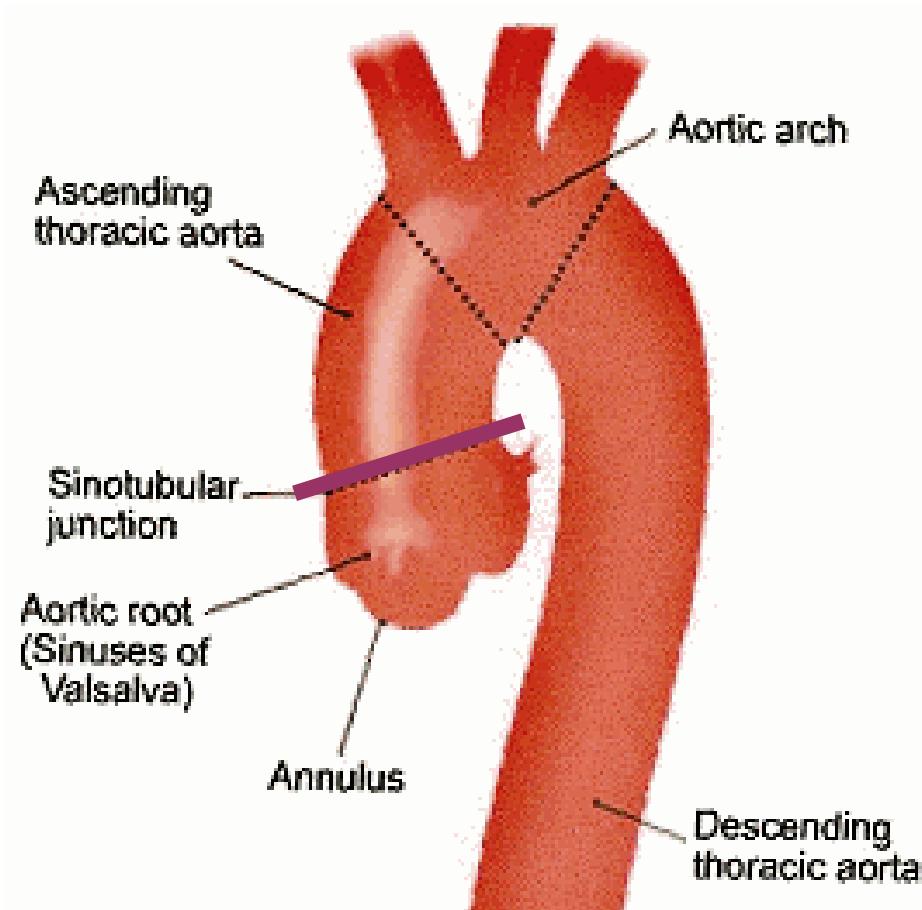

- Preventieve operatie:**

- Voorkomen van dissectie.
- Voorkomen van ruptuur.
- Wortel of ascendens bij >55 mm.
- Descendens bij >60 mm.
- Bindweefselaandoening bij >45 mm resp >50 mm.

- Concomitante operatie bij andere hartoperatie**

- Bij diameter >45 mm.

Aortic root

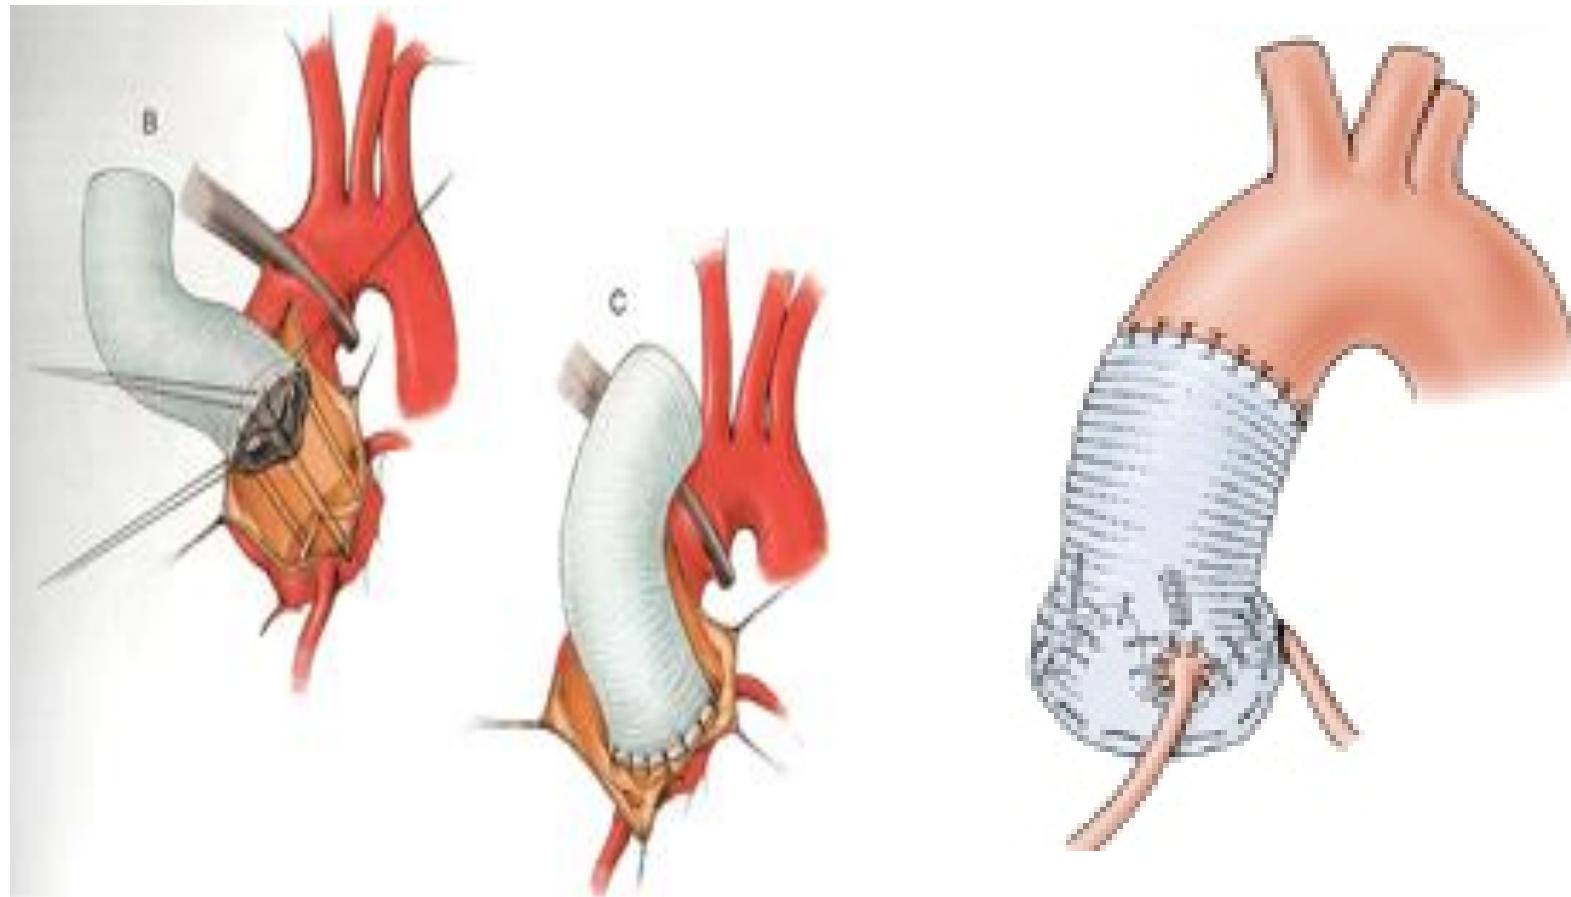

Root / Wortel vervanging

Bentall

Davids Plastiek

Yacoubs plastiek

Bentall

Bentall procedure results

- 41 publications; surgery from 1968-2012
- N=7,165 (36,000 pt yrs), mean pooled age 46 years, 76% male
- Operative mortality: 1.2-20% (mean 5%)

Late mortality 2.3%/yr

Reoperation

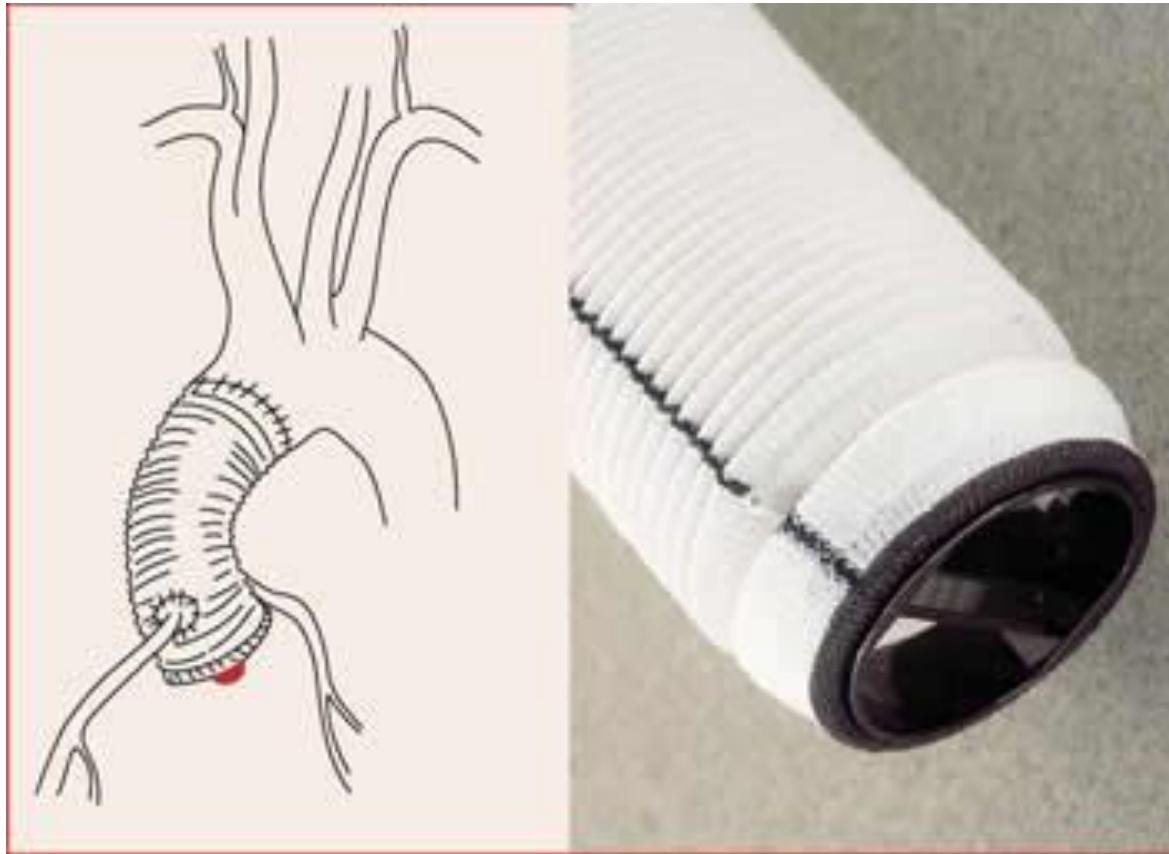

-Root 0.8%/yr

-Valve 0.6%/yr

TE 1.0%/yr

Bleeding 1.2%/yr

Is it safe???

David vs Yacoub

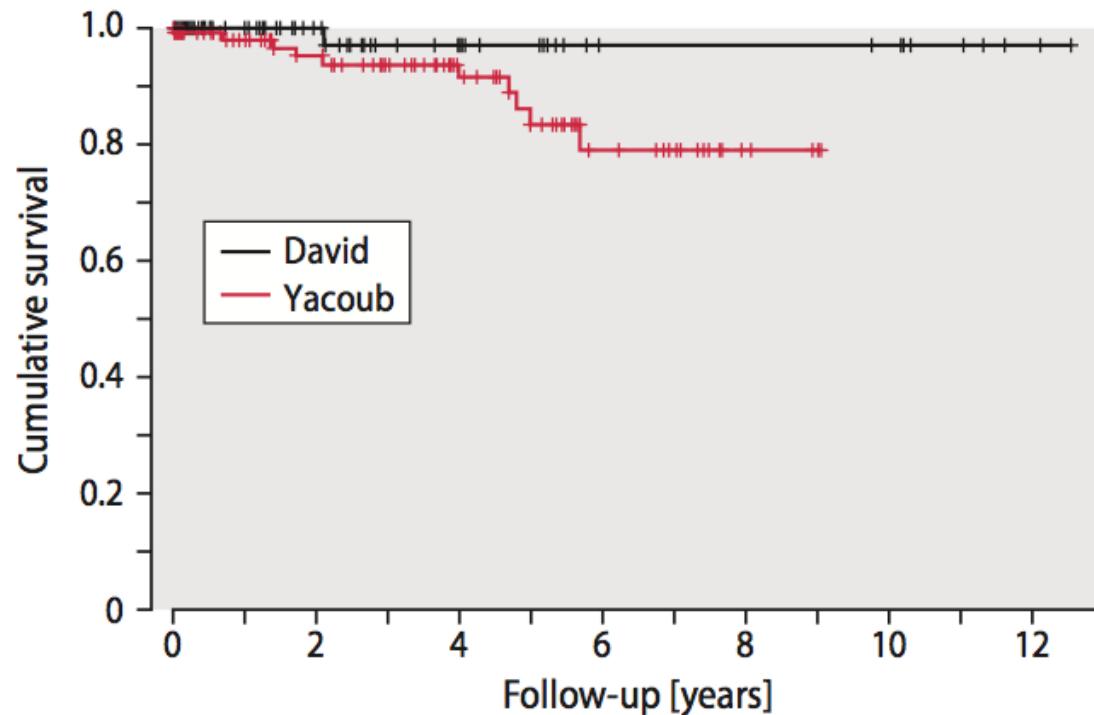

Fig. 4. Valve-related reoperations: actuarial freedom from valve-related reoperations in all patients undergoing valve-sparing aortic root replacement, stratified by technique. Censored patient data are indicated by ticks to the curves. The difference is not quite significant ($p=0.065$)

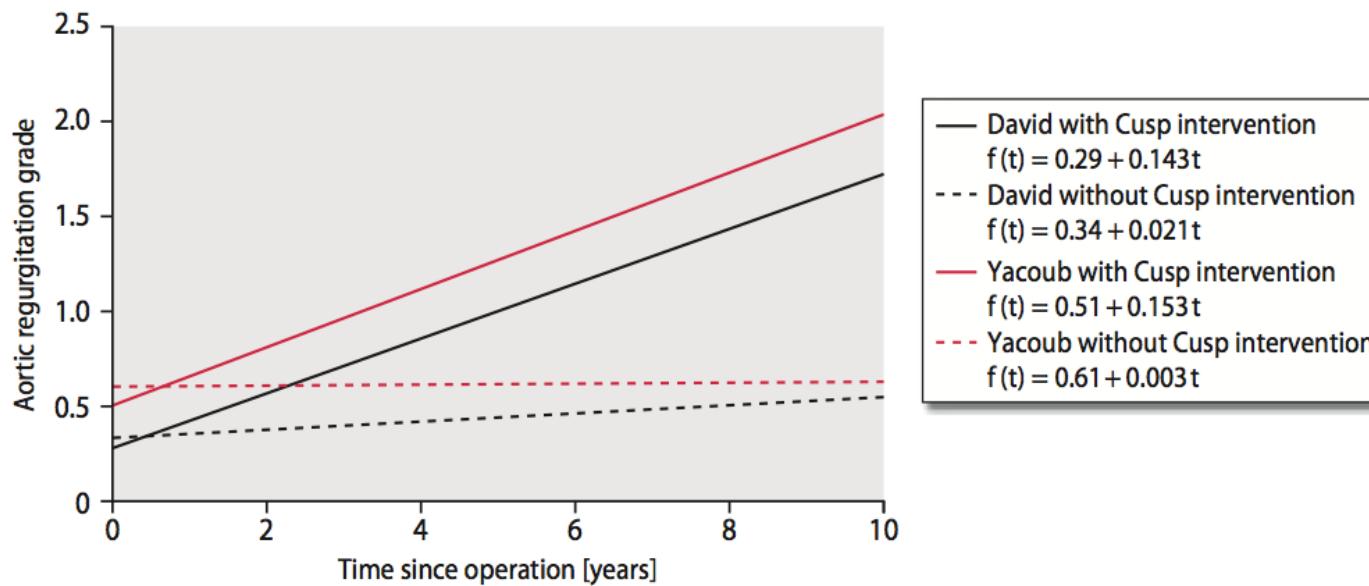

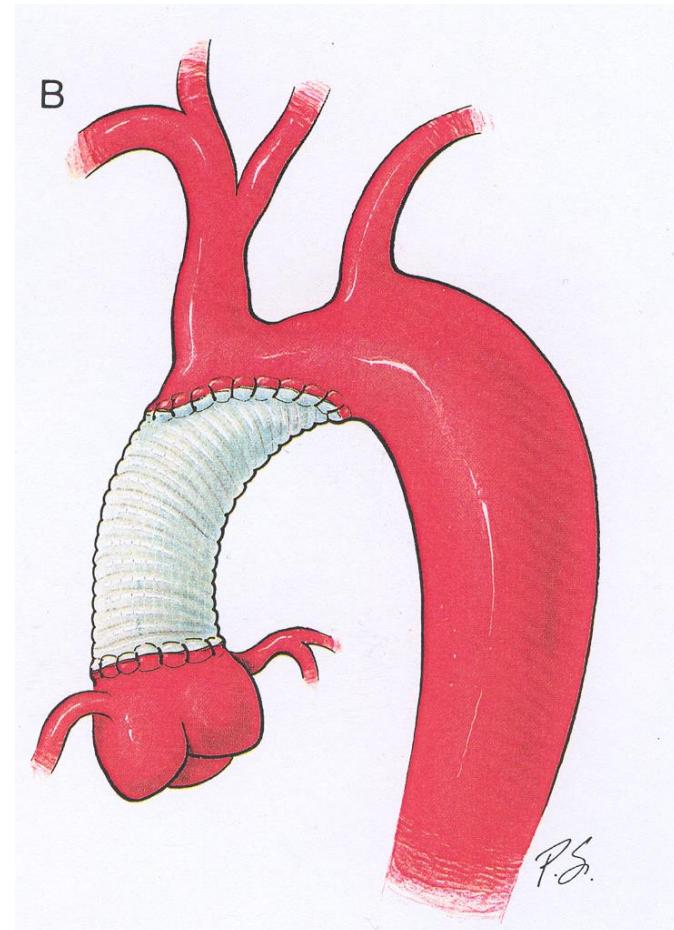

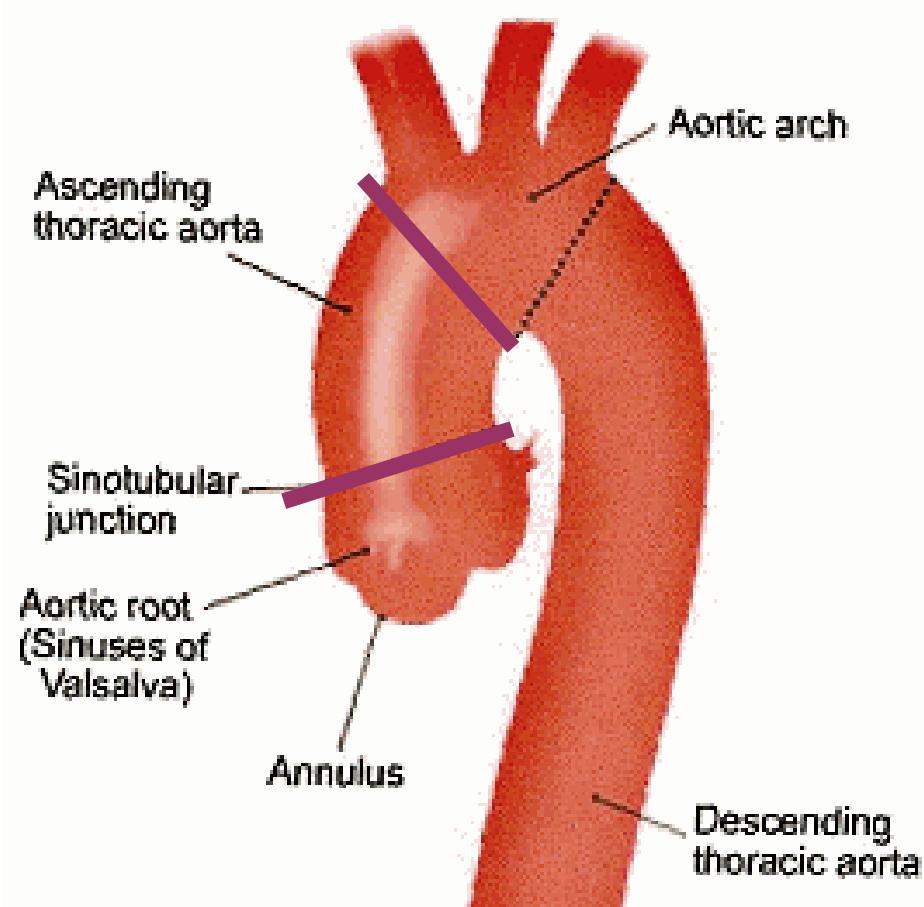

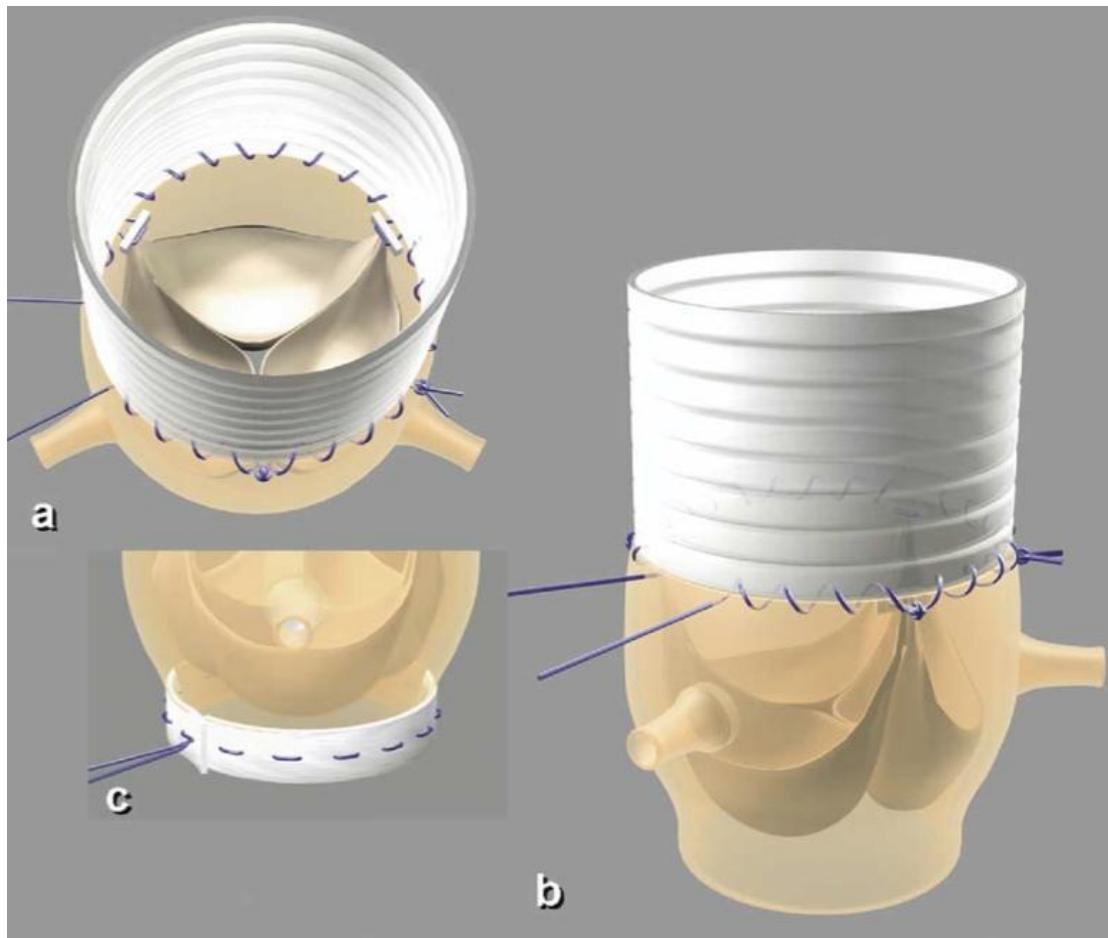

Fig. 6. Estimation of aortic regurgitation (AR) with time in patients undergoing valve-sparing aortic root replacement, stratified by technique and by use/non-use of concomitant cusp interventions (predominately central plication). There is no evidence that the mean intercepts differ depending on whether there were cusp interventions or not ($p=0.38$), but there was significant evidence of an increase in the annual progression rate of AR with cusp interventions for both surgical techniques ($p<0.001$). Adapted from [8]; with permission from the American Association for Thoracic Surgery

Arch and beyond.....

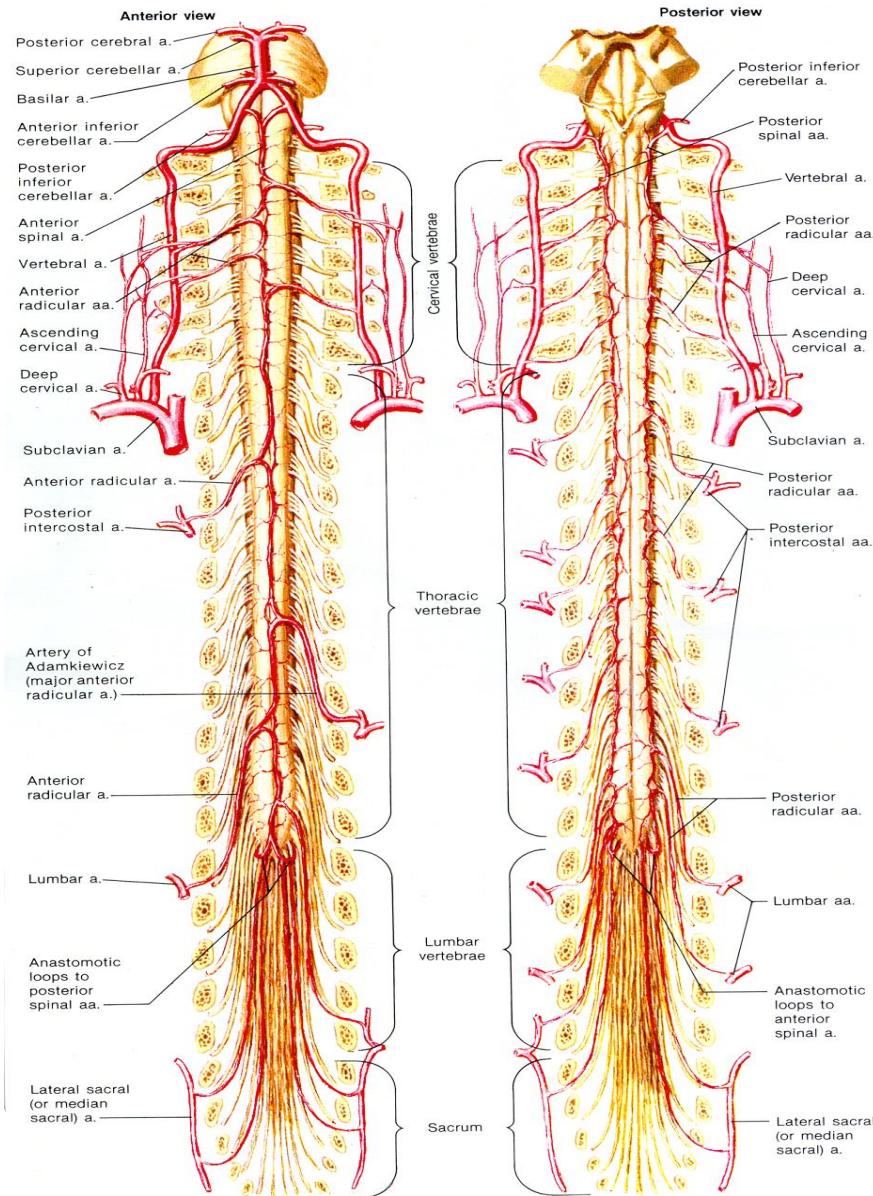

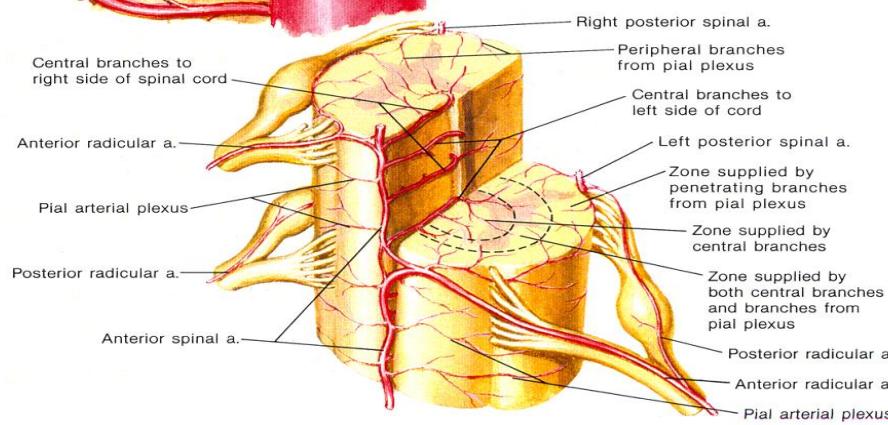

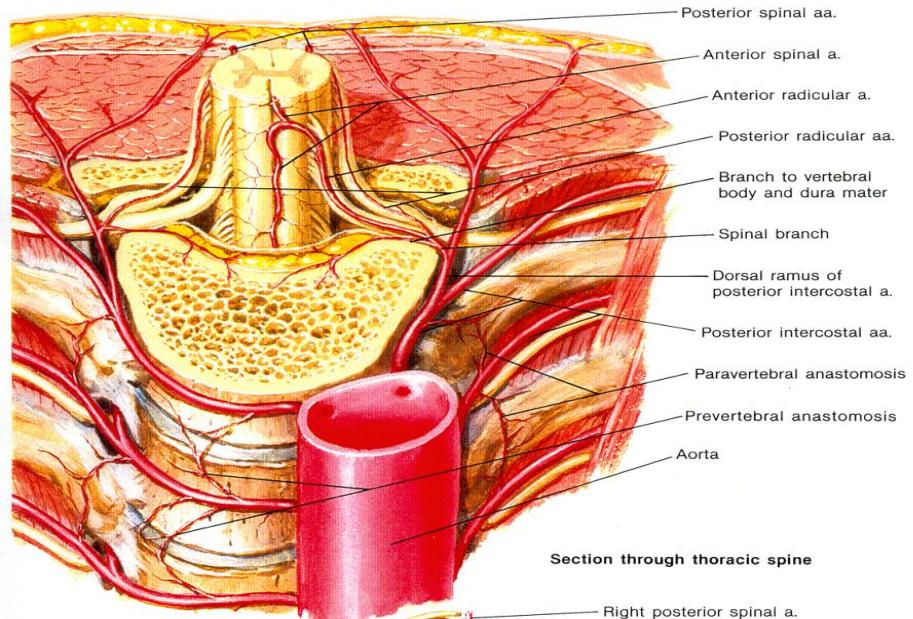

Thoracoabdominal aorta aneurysma

Repair

Actieve bypass: links-links bypass

**aorto- of atrio - femorale bypass
centrifugaalpomp
heat-exchanger
heparine gecoat circuit**

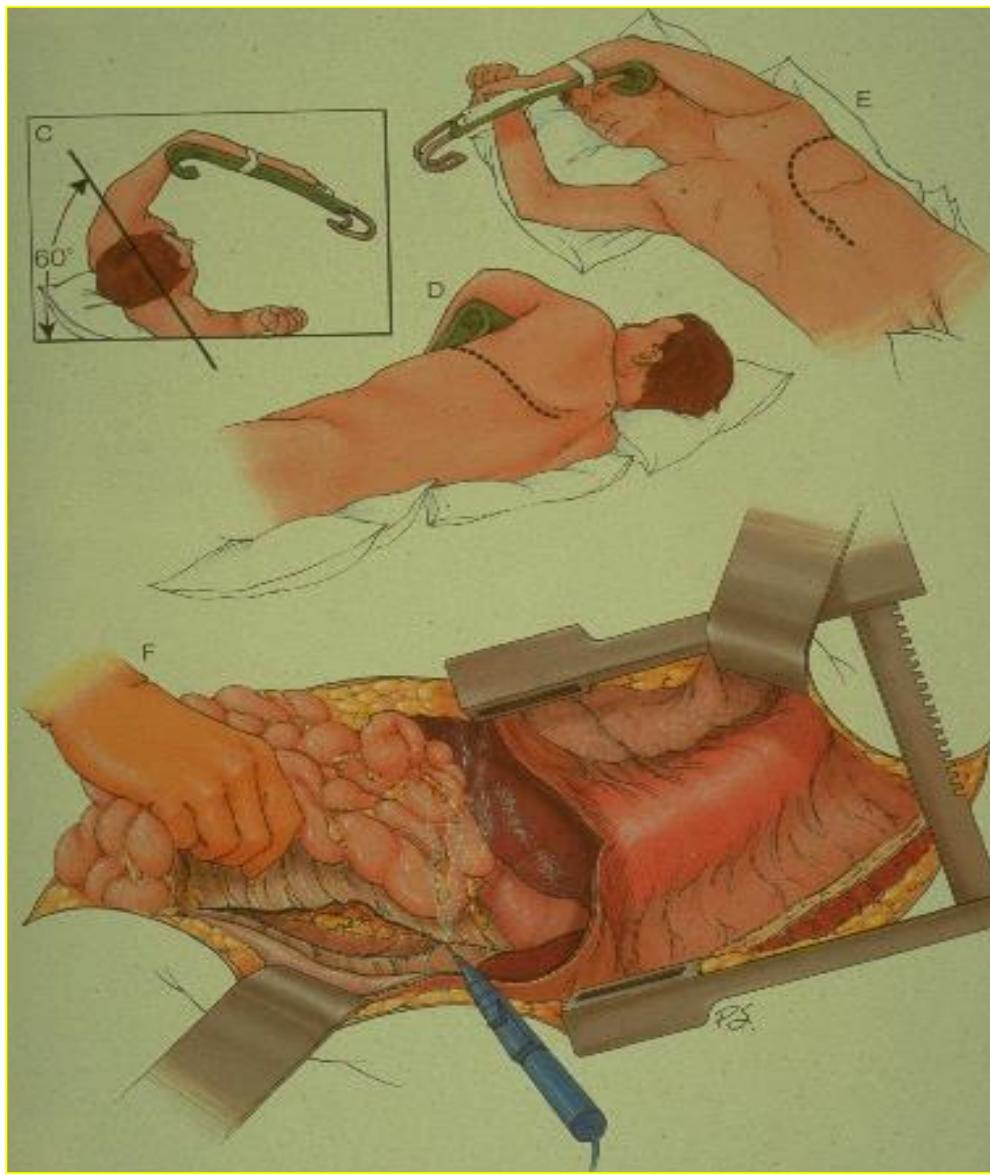

Liquordrainage

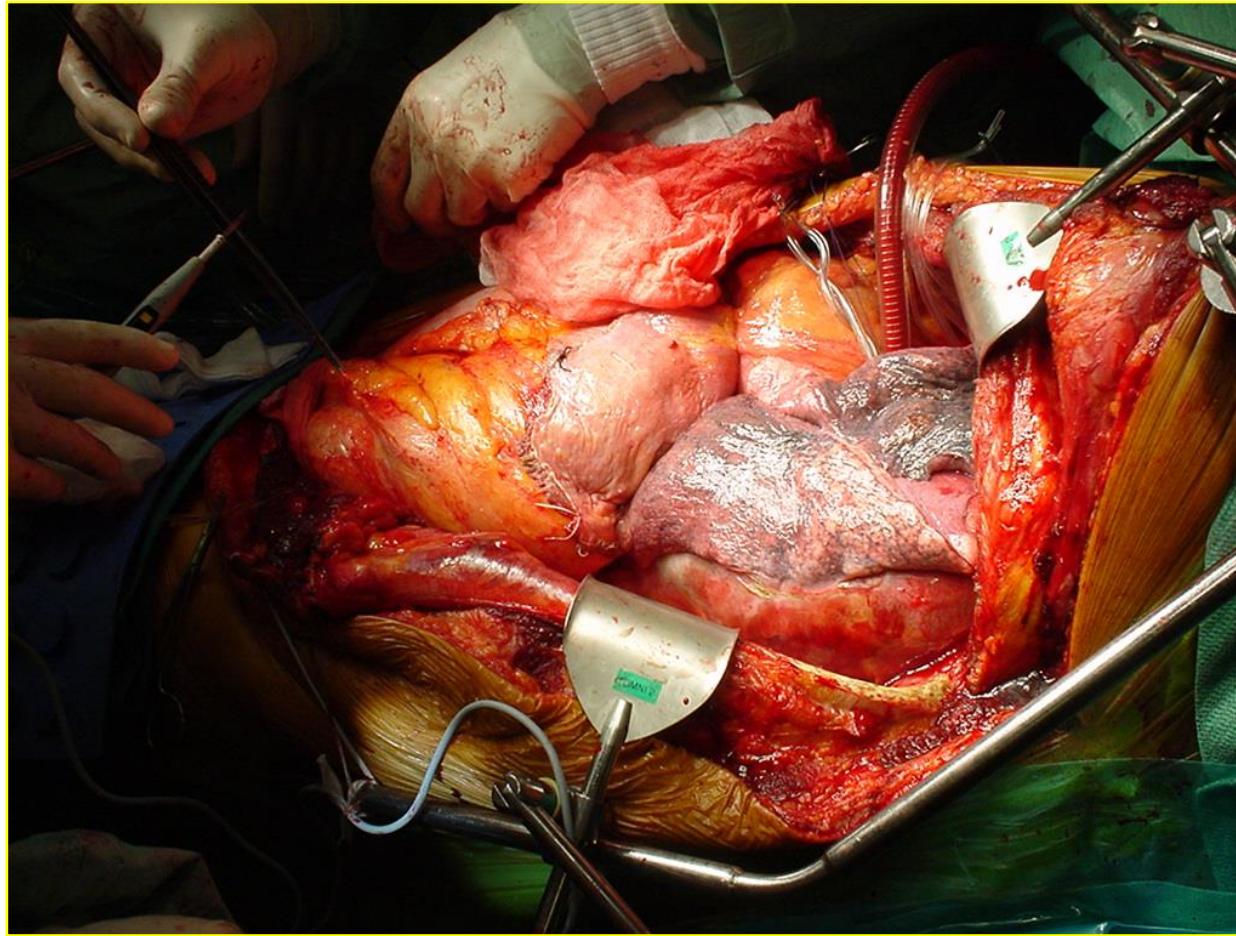

verlaging van de liquordruk (< 10 mmHg)

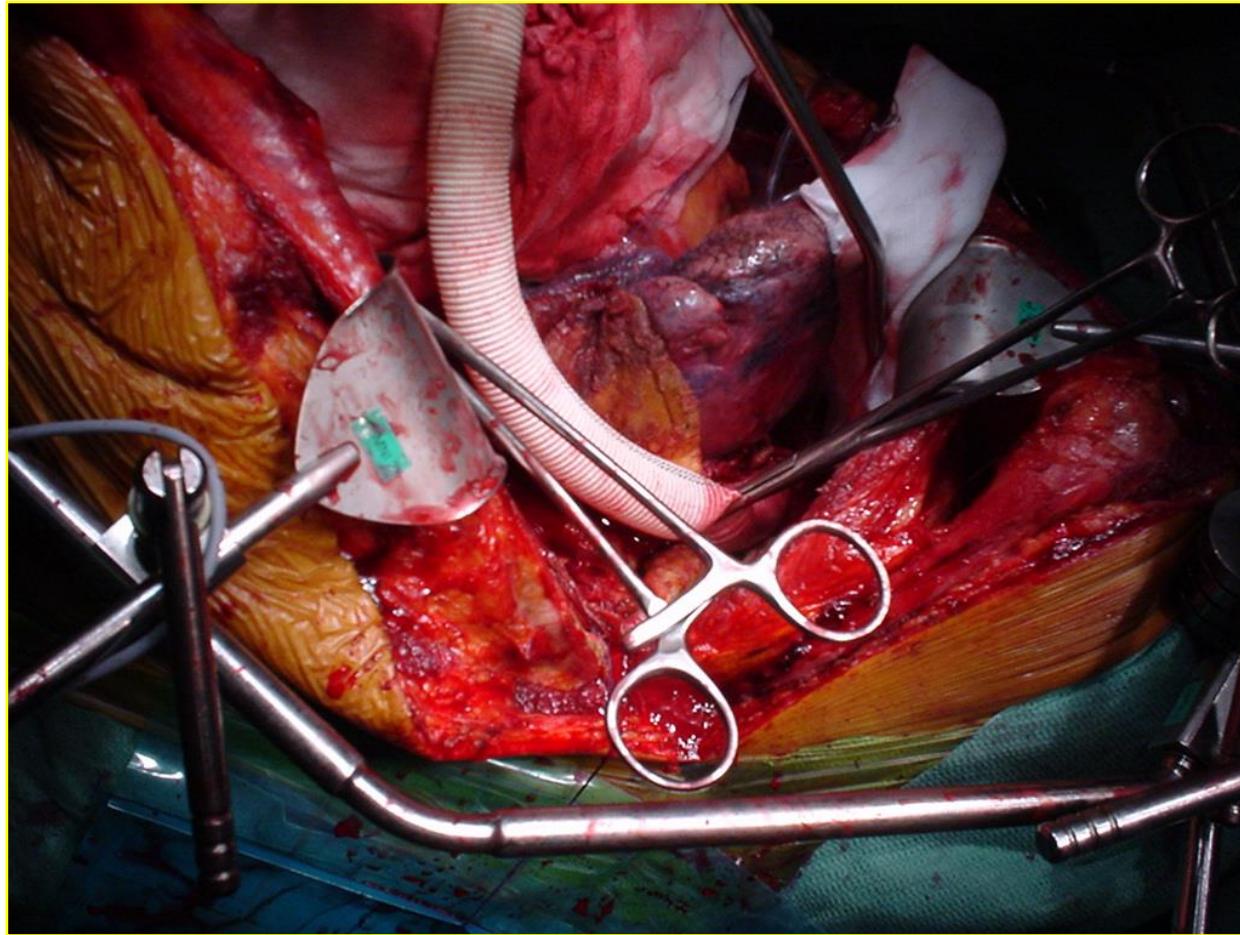

toename ruggemergperfusiedruk

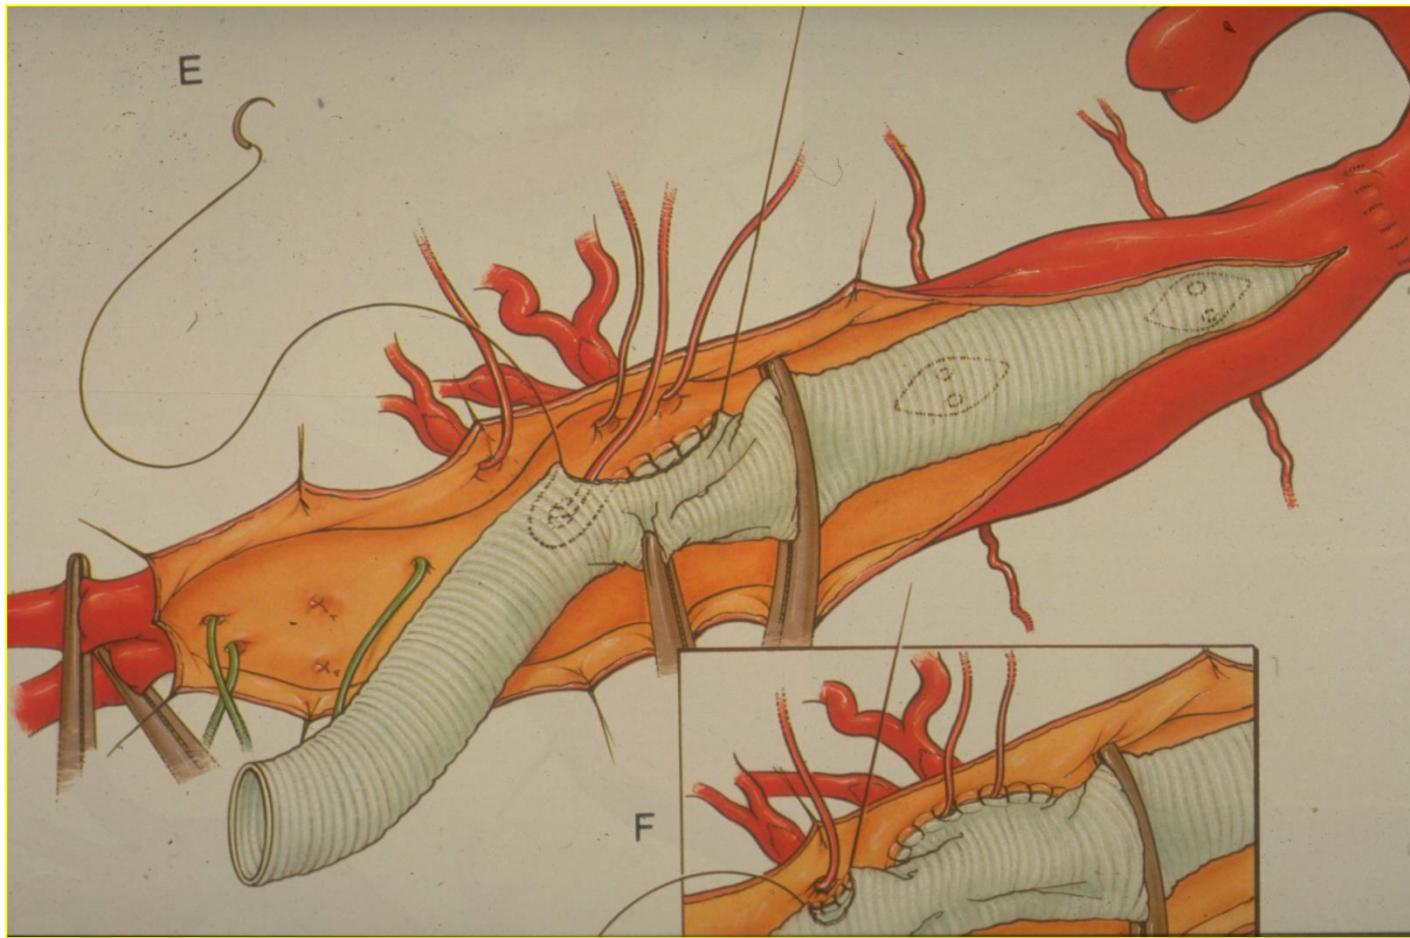

3 dagen post-operatief liquordrainage

- **voorkomt verlate paraplegie**
- **preventie bij perioden van post-operatieve hypotensie**

SEP monitoring

- **controle sensibele zenuwen aan posterior en laterale zijde ruggemerg**
- **stimulatie van de n. tibialis**
- **potentiaalmeting bij cerebrale cortex**
 - **latentietijd**
 - **amplitude**

MEP monitoring

controle motorische voorhoorn cellen

- **informatie over doorbloeding a. spinalis anterior**

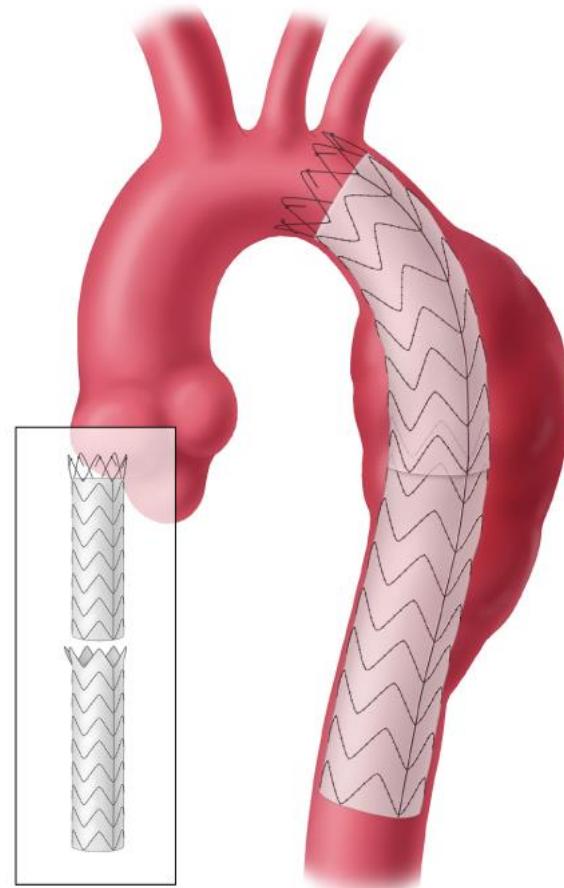

stimulatie motorische cortex: 500 Volt !

Meting in beenspier (myogene MEP)

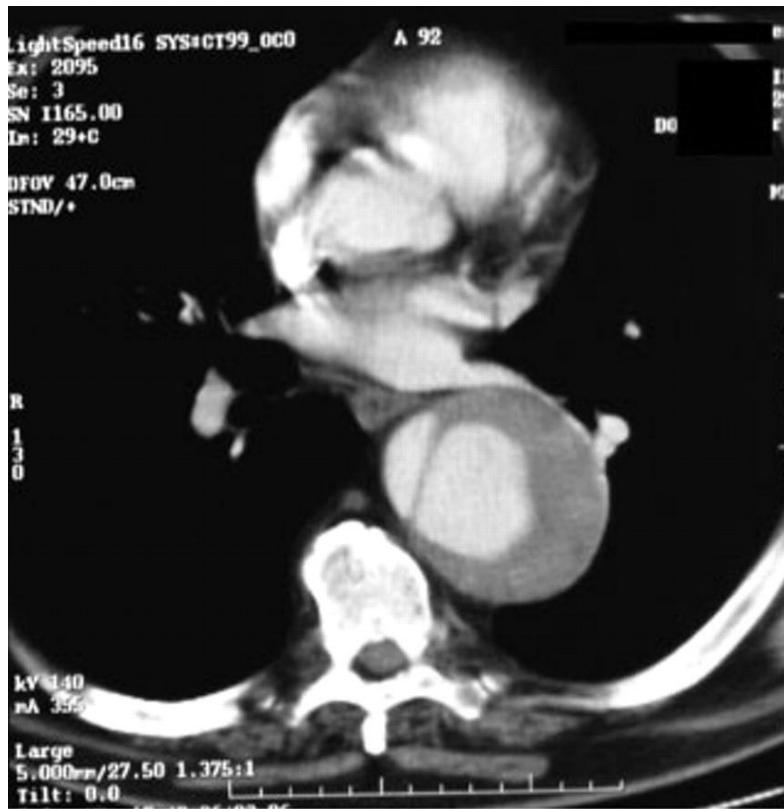

TAAA Chirurgie

- Open TAAA resectie:
 - Mortaliteit 10%
 - Paraplegie 10%

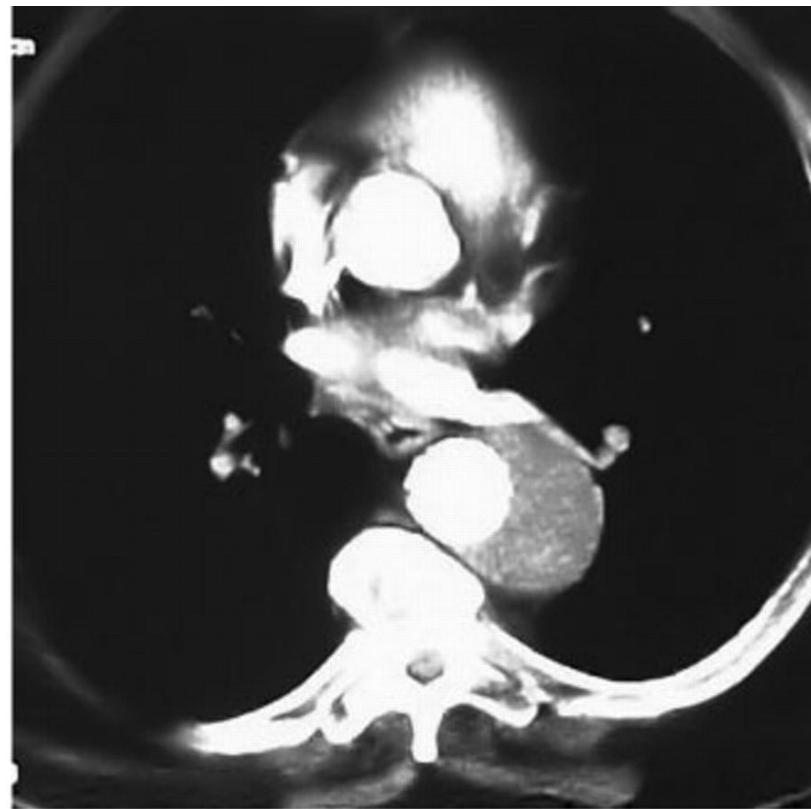

TEVAR

CT scan

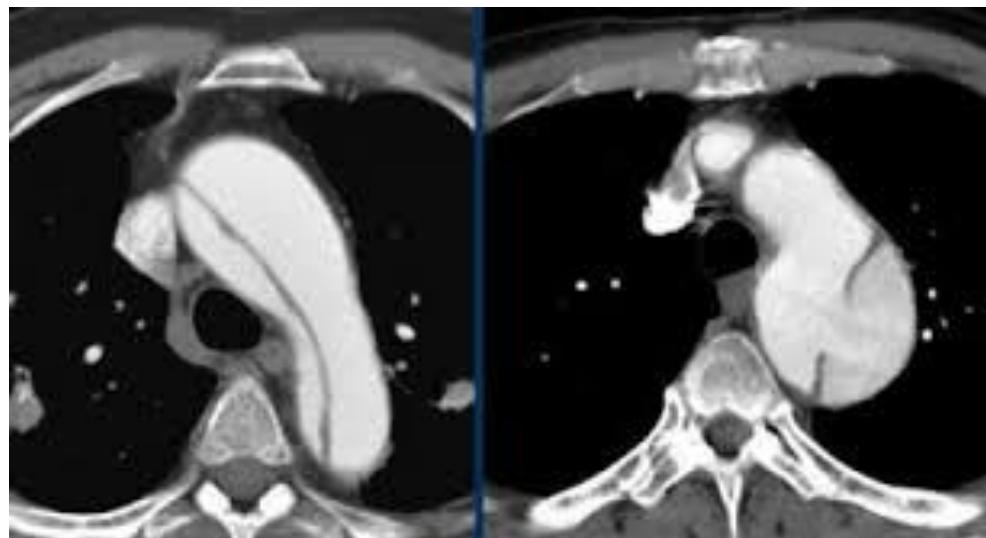

A

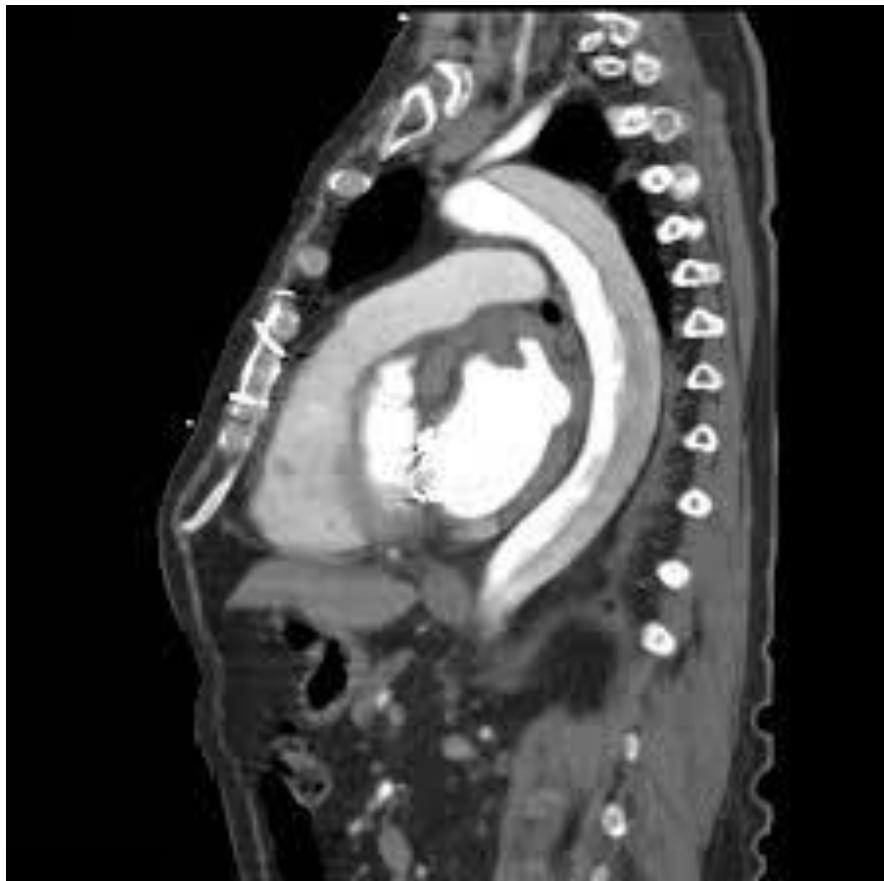

B

Entry tear

False lumen

General considerations - lifestyle

Discourage: competitive sports and isometric heavy weight lifting - to reduce aortic wall shear stress
body contact sport activities

Leisure sportive activities with low static/low dynamic stress acceptable

Medical

Blood pressure - 130/80 mm Hg

Avoid blood pressure peaks

Indications

Progressive thoracic aortic enlargement: >10 mm/year

False lumen aneurysms: with total aortic diameter >60 mm

Malperfusion syndrome

Recurrent pain

“optimal treatment in patients with chronic AD is, however, unclear”

2014 ESC Guidelines on the diagnosis and treatment of aortic diseases

Open Repair

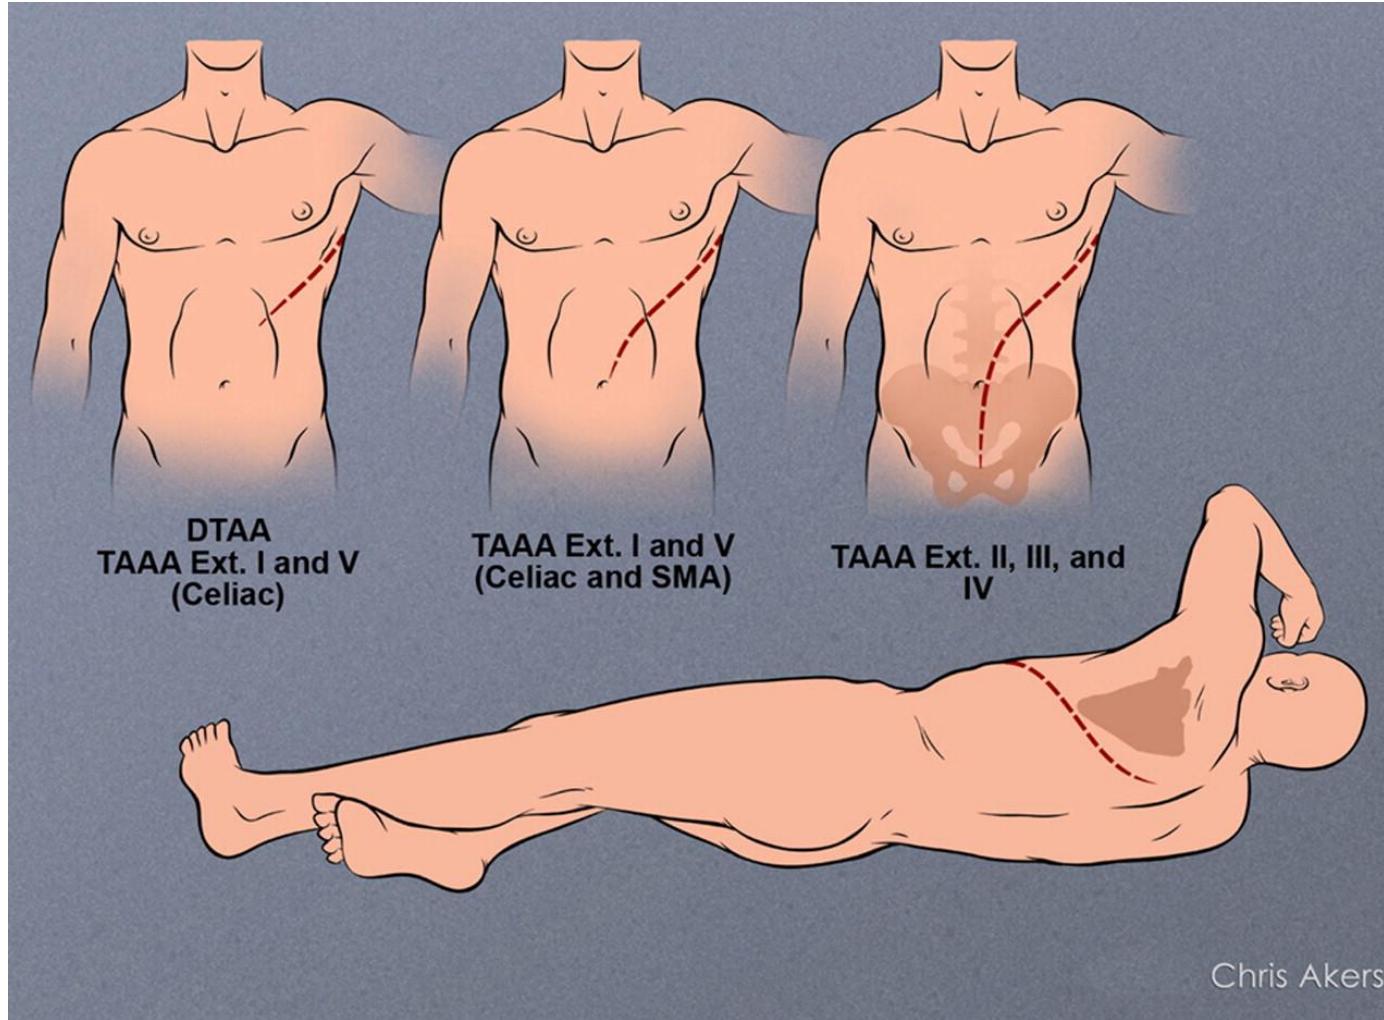

High mortality and morbidity

Left-left bypass

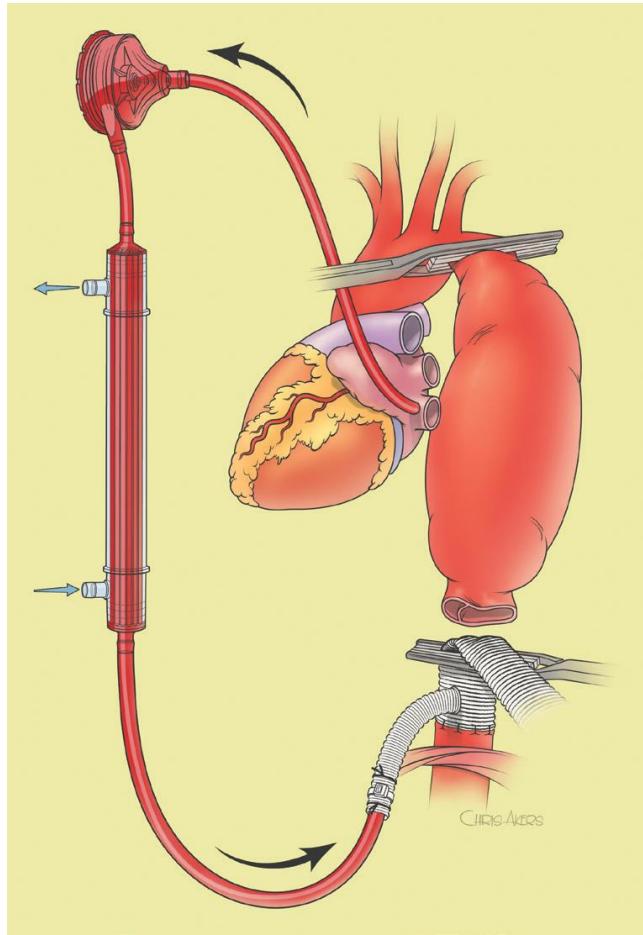

Partial ECC

Deep cooling

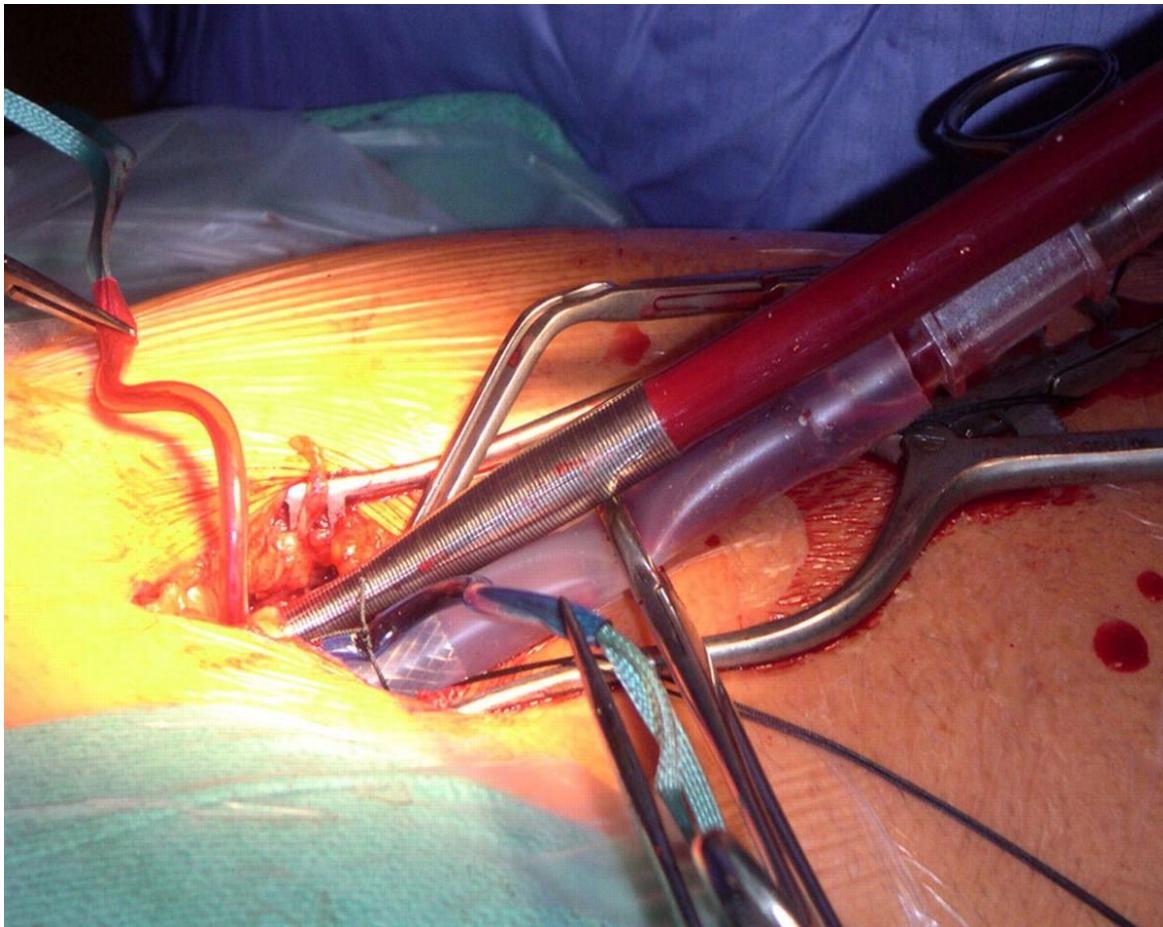

Incision

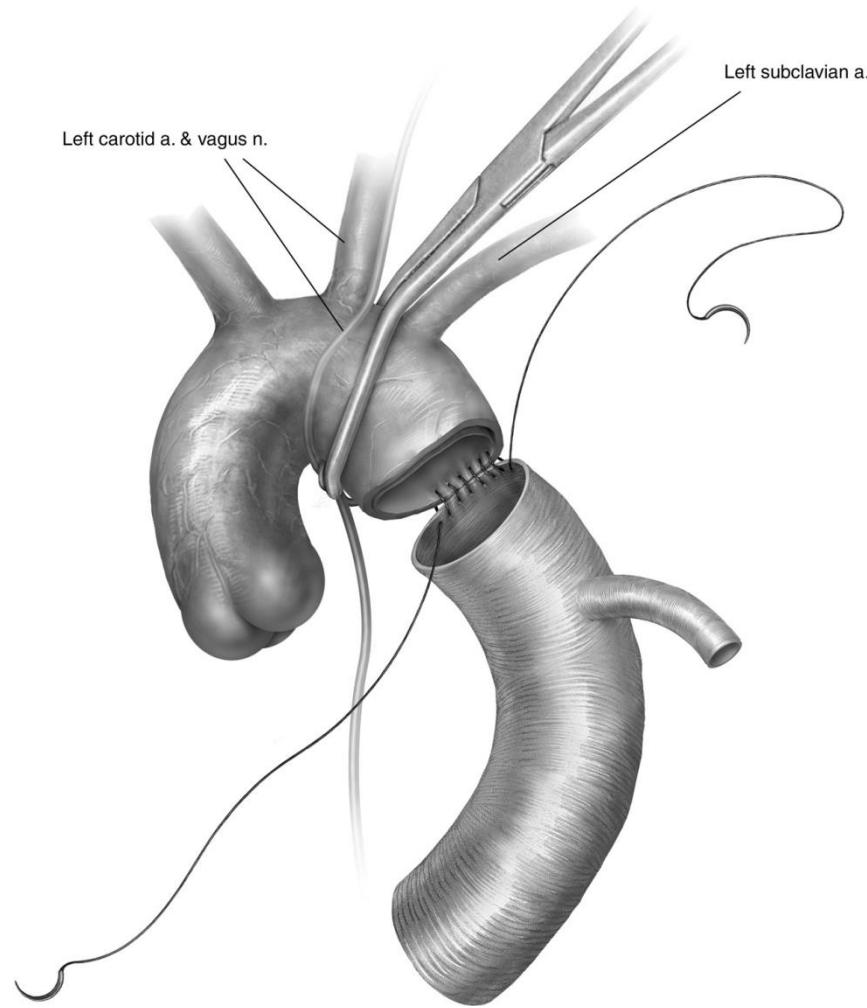

Left-Left bypass

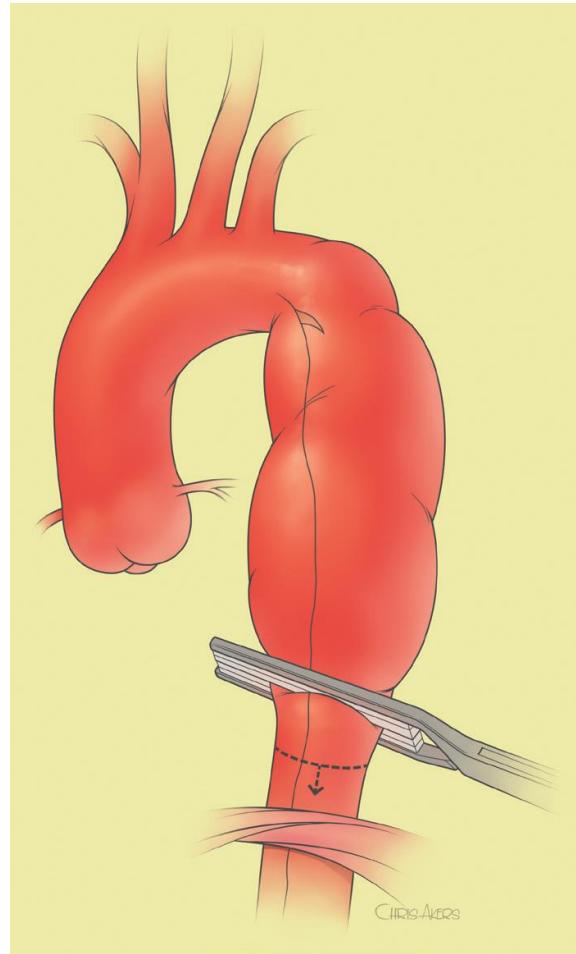

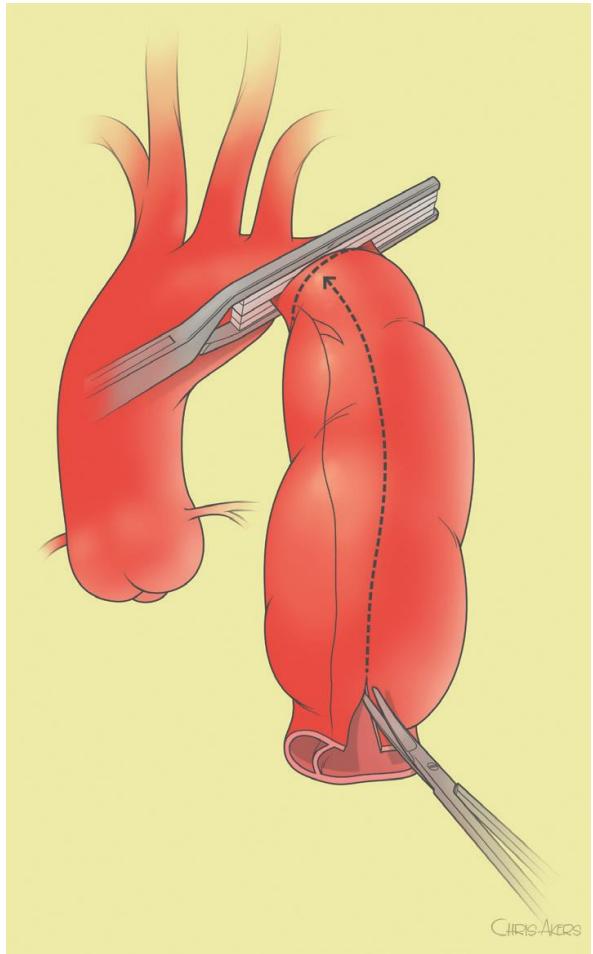

Partial ECC

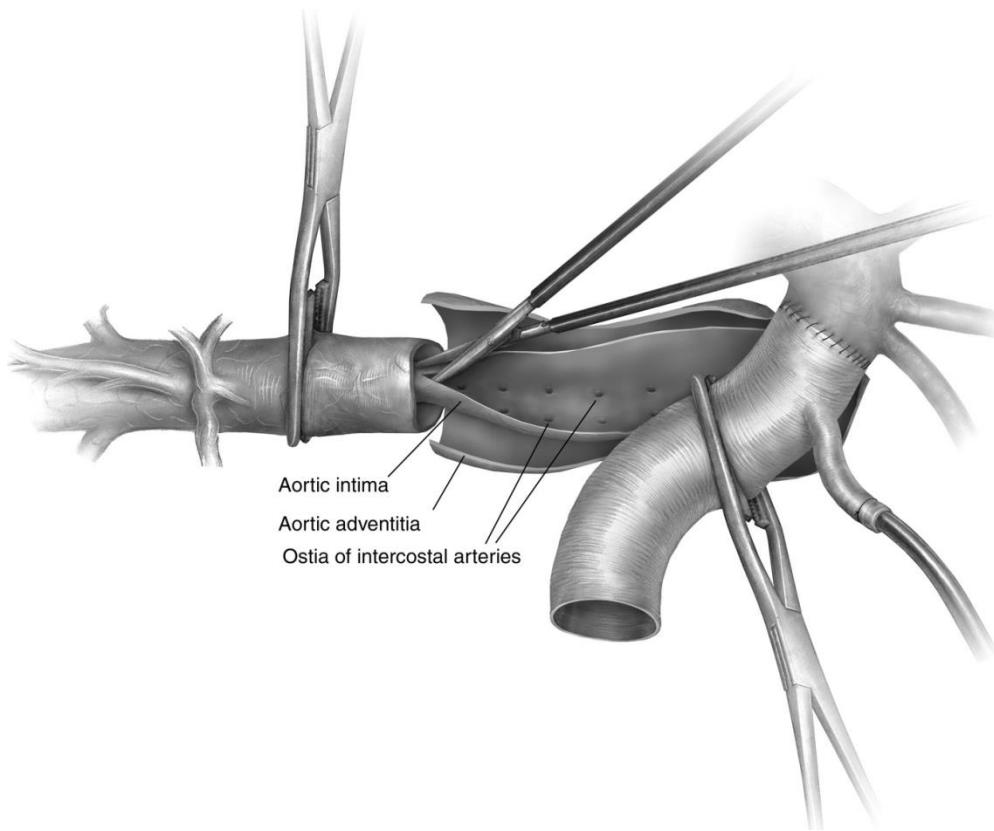

Proximal anastomosis

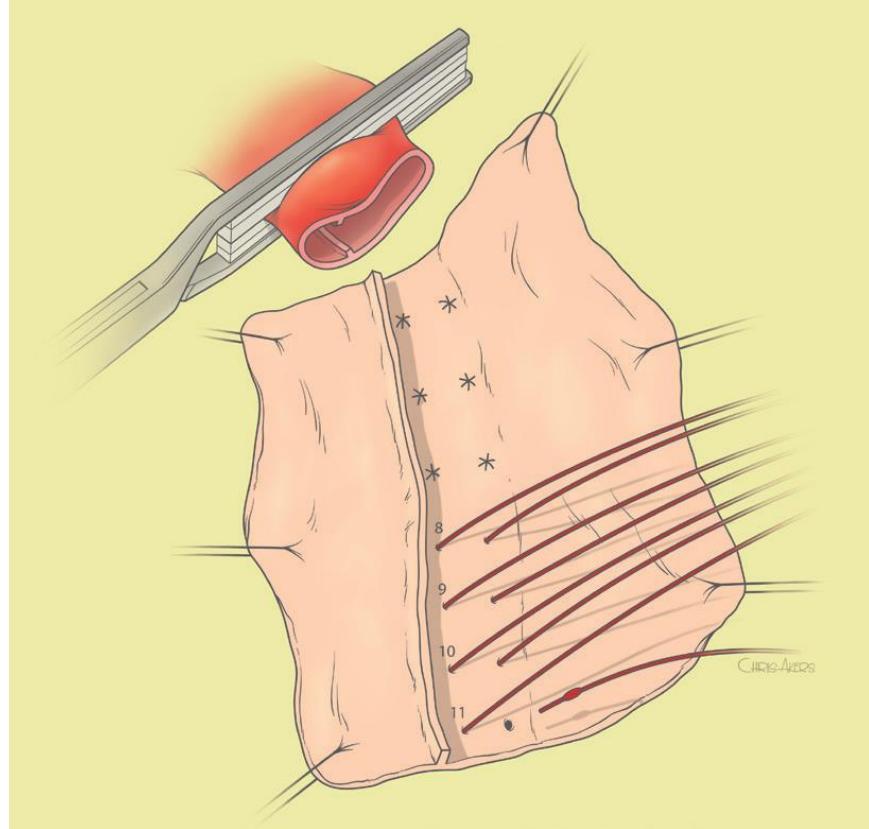

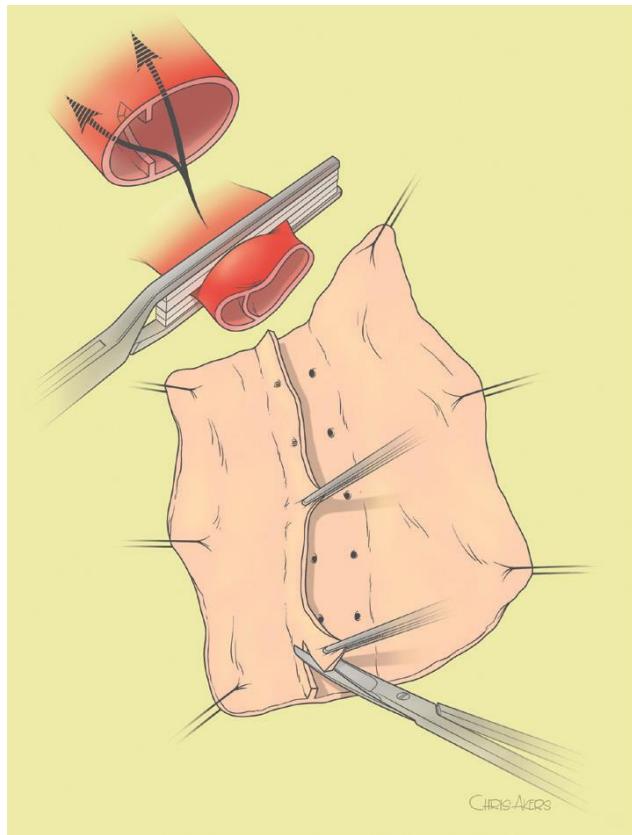

Sequential clamping

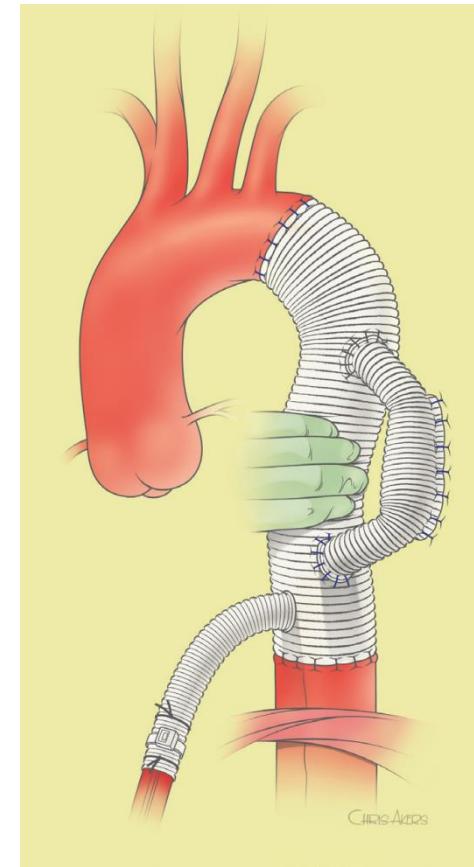

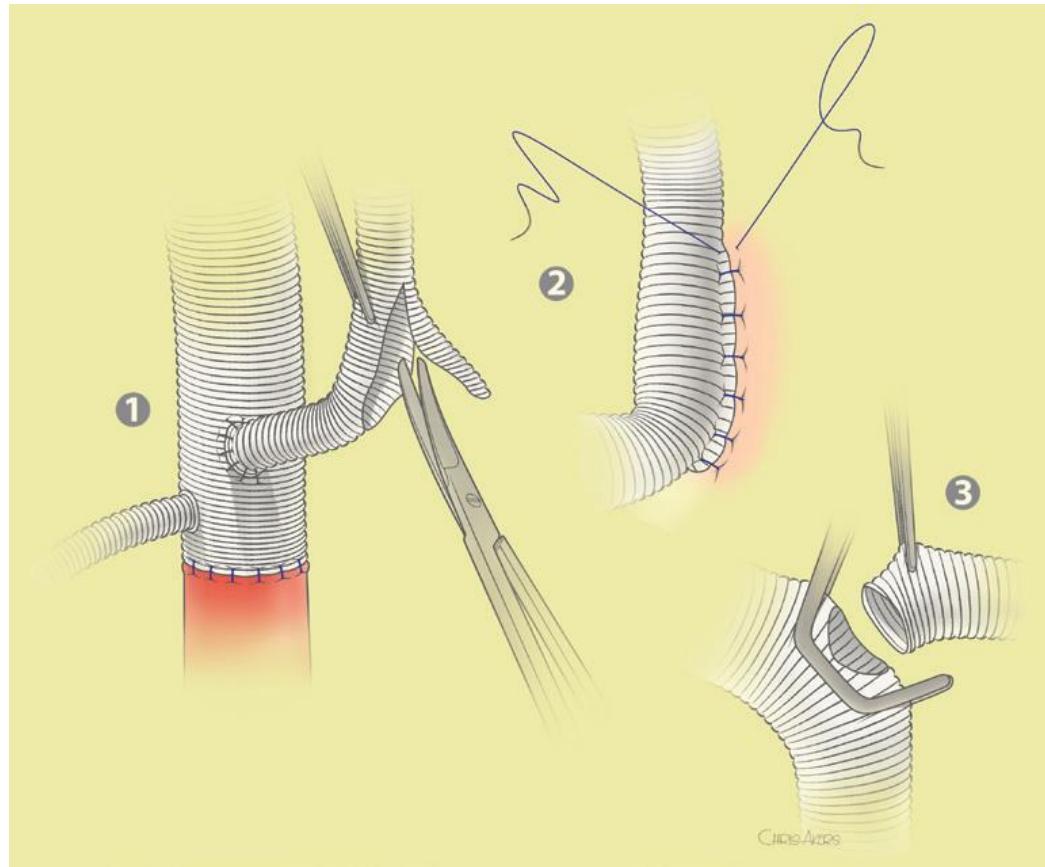

Distal clamping

Intercostal branches

Reimplantation and completion of repair

Completed repair

Post-operative outcomes

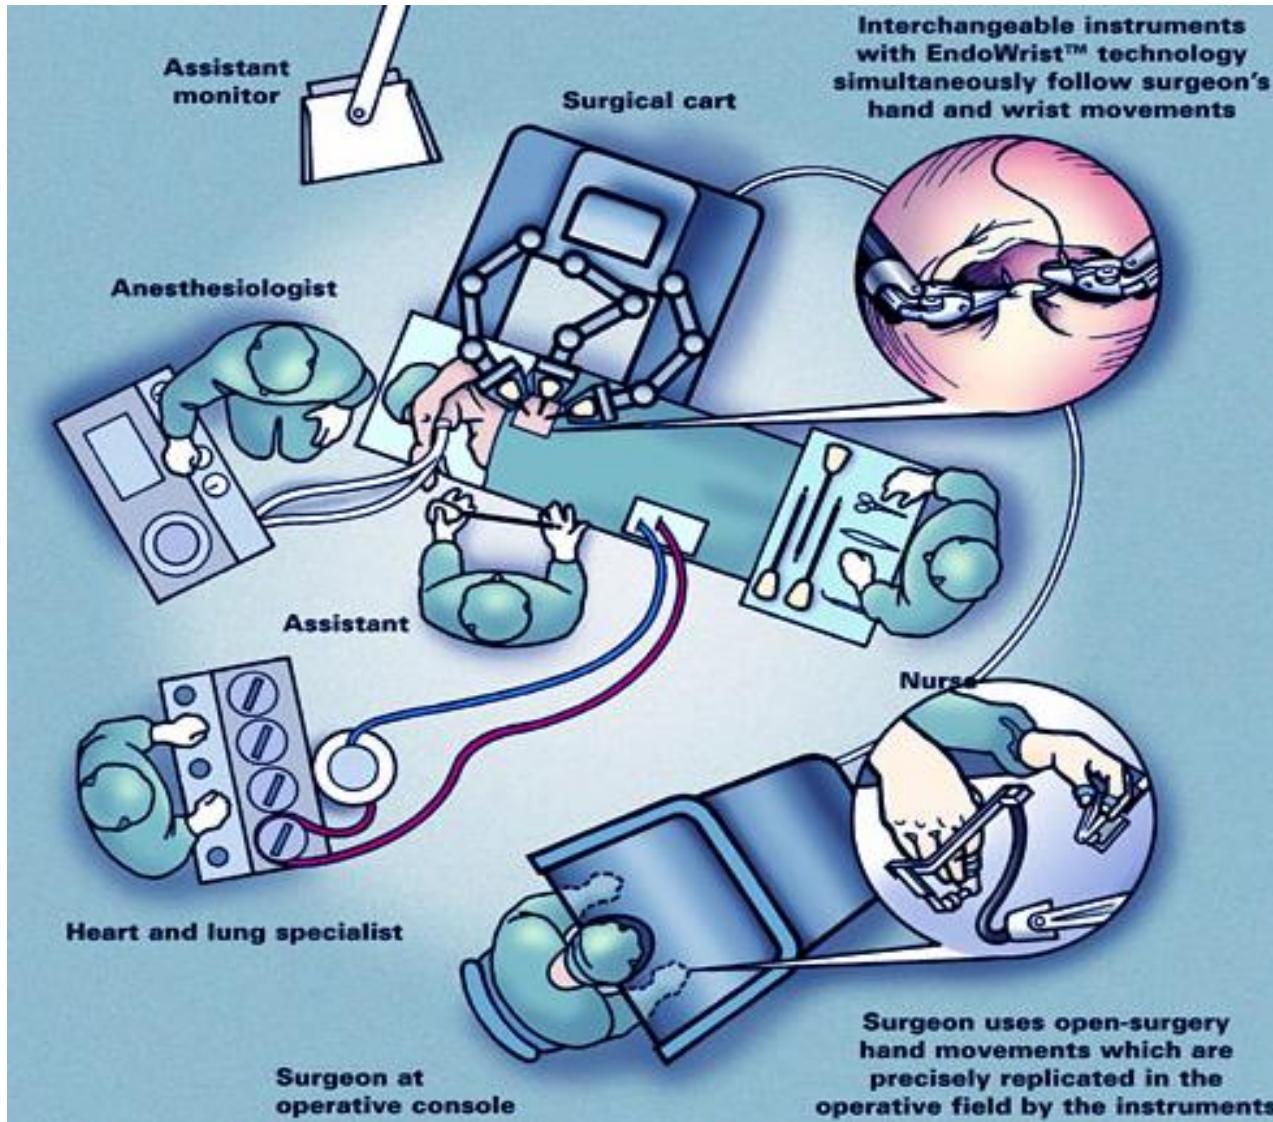

Complications	N [%] (total =240)
Prolonged intubation (>48 hours)	56 [23]
Tracheostomy	9 [4]
Mean length of stay (days)	13.2±9.0
Dialysis on discharge	12 [5]
Stroke	7 [2.9]
Immediate neurologic deficit	2 [0.8]
Delayed neurologic deficit	3 [1.3]
Permanent neurologic deficit	3 [1.3]
30-day mortality	20 [8.3]
